03 CALORIE BLOCKER

01 · WHAT IS THE GENE-DIET?

What exactly is the Gene-Diet?

The Gene-Diet is a personalized weight-loss and nutrition program based on an analysis of your genes. Instead of a standard diet plan, you get an individual recommendation because your metabolism reacts genetically differently than others — to fat, carbohydrates, exercise, and even hunger.

What do I actually get?

You receive an individual report with your optimal ratio of fat, carbohydrates, and protein; a personalized food list with over 1,500 foods; a 4-week daily meal plan; a recipe book; and concrete exercise and movement recommendations that match your genetic profile.

How long are my recommendations valid?

Your genes do not change throughout your life, so the genetic results remain permanently valid. The evaluation, however, is continuously refined based on new research — over 770 improvements have been incorporated since program launch.

Do I need to repeat the test regularly?

No. Genes stay the same for life — an already-analyzed gene always returns the same result. What does keep improving is the evaluation itself, as new scientific findings are continuously incorporated.

02 · HOW DOES THE GENETIC ANALYSIS WORK?

How does the Gene-Diet program work?

From your genetic dataset, the variants relevant for weight control are selected. From these, we calculate: how sensitive is your body to fat and carbohydrates? How effective is exercise for you? How effective is calorie reduction? Do you tend toward Yo-Yo effect, muscle loss, or belly fat? From these results, your optimal macro distribution and an individual nutrition plan emerge.

Isn't losing weight just about calorie deficit?

Not just. Studies show that people react genetically very differently to fat and carbohydrates — some hardly gain weight at a calorie surplus, others on the same calories gain much more. The effectiveness of exercise also varies genetically by a factor of 3.

Are there 7 different nutritional types?

Yes: Fat utilizer (higher fat share), Mixed type I-V (different mixed distributions), and Carb utilizer (higher carb share). Combined with individual factors like basal metabolic rate, exercise effectiveness, and Jo-Yo tendency, there are over 6,500 possible genetic profiles.

From what age is the program suitable for children?

The program is basically also applicable to children, but without calorie calculations, target-weight recommendations, daily menus, or recipe book — these are not meaningful for growing children. The recipe book is locked for children under 14.

03 · CALORIE BLOCKER

What is the Calorie Blocker?

The Calorie Blocker is a personalized weight-loss product in microtransporter-pellet form. It contains an individual ratio of fat and carbohydrate blockers tailored to your DNA analysis. Combined with reduced calorie and fat intake, it demonstrably supports weight loss — combined with balanced diet and lifestyle it helps maintain weight.

How do I take the Calorie Blocker?

Daily before lunch and dinner with a large sip of water. The pellets should be swallowed whole, not chewed.

What are the active ingredients?

The fat blocker is Opuntia ficus-indica (OFI) — the fiber of the prickly pear cactus. This plant fiber forms a gel-like matrix in the GI tract that binds dietary fat and reduces its absorption. The carbohydrate blocker is Phaseolamin (from white beans) which inhibits alpha-amylase. Both are fully plant-based.

Is the Calorie Blocker vegan/vegetarian?

Yes. Both the fat blocker (Opuntia ficus-indica) and the carbohydrate blocker (Phaseolamin from white beans) are purely plant-based. The Calorie Blocker is suitable for vegetarians and vegans, gluten-free, lactose-free, and free of artificial colourings.
